

Roadmap : Capacity Building

Sustainable growth of the sector will require Govt. agencies to be strengthened for governance purposes.

Apart from compliance with legislation and best practices, capacity building here also refers to delivery of value adding services and products to enhance sustainable growth of the sector.

Reducing costs of exploration via data packages and modern geological information repositories can accelerate or reduce the traditionally long gestation period for mineral sector projects. After all, exploration is indeed the building up of a knowledge base of minerals in the ground.

Strategies above are to provide an environment to develop new data, process, capture and transfer it into systems for better service delivery. However, given that geology is based on interpretations, geologists and related professions must be given due recognition and support to ensure the years of investment in building up skills and knowledge are not easily lost from Government.
